課程宗旨： Course Objectives	Machine Learning is a key to developing intelligent systems and analyzing data in science and engineering. Machine learning engines enable smart technologies such as Siri, Kinect, or Google self-driving cars, to name a few. This course assumes that you know close to nothing about Machine Learning. Its goal is to give you the concepts, tools, and intuition you need to implement programs capable of learning from data. We will cover many techniques, from the simplest and most commonly used (such as Linear Regression) to some Deep Learning techniques that regularly win competitions. Rather than implementing our toy versions of each algorithm, we will be using production-ready Python frameworks: Scikit-Learn, TensorFlow, and Keras.
課程大綱： Outline of Lectures	Module 1：Basic ML -Linear Regression -Classification -Regulation + Diagnosis -Dimensionality reduction -Unsupervised Learning Module 2：Tree-based ML -Decision Trees -Random Forest -Gradient Boosting/XGBoost/LightGBM Module 3：Neural Networks -Neural Networks -CNN -RNN -GNN -LLM Module 4：XAI -Basic XAI：Model-agnostic vs Model-specific，Local vs Global explanation -XAI：SHAP/LIME -Image XAI Module 5：RL Module 6：Adversial Attacks/defense (optional)
